

L4 PROBLEM 8 (5 points possible)

Write a Python function, `fourthPower`, that takes in one number and returns that value raised to the fourth power.

You should use the `square` procedure that you defined in Problem 3 of these lecture exercises (you don't need to redefine `square` in this box; when you call `square`, the tutor will use our definition).

This function takes in one number and returns one number.

```
1 def fourthPower(x):
2     '''
3     x: int or float.
4     '''
5     # Your code here
6
```
